

# Where do you want to eat?

A question that is often asked but, can be difficult to answer. We have developed a solution to this problem.

**zomato**

**Zomato API**

Power your content with the most exhaustive curated restaurant information

Our program is based out of Python and designed to run cyclically utilizing the user's inputs such as location, budget, and cuisine preference.

After receiving the user's inputs for location, budget, and cuisine preference, we run that data against the Zomato API to print a list of restaurants that fit the user's inputs in addition to their name, rating, and address.

With the location that we receive from Zomato, we then send that through the OpenStreetMap API to plot all of the points of the restaurants so the user can understand where they would be going or ordering from.

**OpenStreetMap**
